(a) Fitted erasers at $d = N = 32$
exact frontier $R_d^*(b, \kappa)$
INLP, 1 step
excess 0.18, predicted from the fitted kernel
LEACE: same kernel, oblique map
MP, SAL, R-LACE
INLP, 4 steps
R-LACE, 4 deletions
infeasible for any shared linear editor
Population residual
Distortion cost $\|M - I\|_F^2$
(b) Wearable vs. clinical EEG, $d = 118$
$P = 1$
$P = 4$
$P = 8$
$P = 32$
Shift left in new participants
Epochs per calibration participant n
(c) Detected long before repaired
detected 97%, half of shift left
detected
MP/SAL/LEACE
Probability / shift left
Calibration participants P ($n = 8$)
